Experiment 7

API Integration with Zoho Creator

Aim

To integrate Zoho Creator with external applications and services using APIs to enable secure data exchange, automate admission-office processes and extend the functionality of the Student Admission Enquiry Management (Advanced Edition) system.

Theory

API integration allows applications to communicate and exchange data with external systems. In the Student Admission Enquiry application, APIs can be used to retrieve enquiry records, send admission data to analytics tools, and connect approved external services through Zoho Creator connections and **invokeUrl**.

Procedure

1. Log in to Zoho Creator and open the Student Admission Enquiry Management (Advanced Edition) application.

2. Identify the external service to integrate, such as Zoho Analytics or the Admission_Enquiry_Report REST API.

3. Configure the required API access and authentication settings using an OAuth connection.

4. Configure the required API credentials and scopes.

5. Use Deluge integration functions to send or receive Admission_Enquiry_Form data.

6. Configure the request URL, HTTP method, headers and parameters.

7. Test the integration and verify that enquiry data is exchanged correctly.

8. Handle errors and validate the returned response.

Applications of API Integration in This Project

• Sending Admission_Enquiry_Form data to analytics for admission dashboards.

• Retrieving school details from an approved external/master service.

• Connecting approved notification services for enquiry acknowledgement.

• Connecting payment-related services for application-fee verification.

• Retrieving enquiry records using the Admission_Enquiry_Report REST API.

Request Details

Item	Value
Method	GET
Target	Admission_Enquiry_Report through Zoho Creator REST API
Authentication	OAuth connection with read scope
Used for	Reading admission enquiries for reports, dashboards and external systems

Sample Deluge

```
baseUrl = "https://creator.zoho.in/api/v2/<account_owner>/";
response = invokeUrl
[
  url : baseUrl + "student-admission-enquiry-management/report/Admission_Enquiry_Report"
  type : GET
  connection : "creator_connection"
];
info response;
if(response.get("code") == 3000)
{
  records = response.get("data");
  info "Enquiries fetched: " + records.size();
}
else
{
  info "API error: " + response;
}
```

Expected Response Format

```
{
 "code": 3000,
 "data": [{
  "Admission_Enquiry_ID": "REC-ADM-2026-001204",
  "Student_Name": "Ananya Ramesh",
  "School_Name": "REC Matric Hr Sec School",
  "Net_Application_Fee_Payable": 4250
 }]
}
```

Integration Flow

Figure 7.1: API integration flow for the Student Admission application

Admission Enquiry Form	OAuth Connection	Deluge invokeUrl	Analytics / External Service

Error Handling Checklist

• Check the response code before processing data.

• Log unexpected responses and notify the administrator.

• Keep credentials inside the connection; do not hard-code tokens.

• Fetch only required records to avoid slow API calls.

Result

Admission_Enquiry_Form was integrated conceptually with the Zoho Creator REST API and analytics services, and the required data-exchange flow was verified.

Conclusion

API integration enables the Student Admission application to communicate with external systems, support analytics and automate approved admission-office processes while maintaining authentication and validation.
